TITLE: The effect of the type of load on the corrosion-fatigue strength of steel

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 5, 1965, 620-621

TOPIC TAGS: corrosive strength, corrosion resistant steel, fatigue strength, cyclic strength, steel / Kh17N2 steel

ABSTRACT: The authors used Kh17N2 steel, which is widely utilized in the manufacture of parts intended for operation in corrosive media, to study the effect of type of load on the corrosion-fatigue strength of steel. The results show that the fatigue strength of specimens in air with a clean bend in the steel is higher than that under axial longitudinal load, and in tests in a corrosion medium this strength is considerably higher than with a clean bend. The conclusions obtained on the cyclic strength in air depending on the type of load do not contradict the existing opinions on the subject. In a corrosive medium the durability under cyclic longitudinal stress is higher than that under cyclic bending. Orig.

TITLE: Effect of electrodeposits on cracking of hardened steel during testing in air and in hydrogenating corrosive media

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 6, 1965, 697-700

TOPIC TAGS: copper, nickel, cadmium, zinc, chromium, protective coating, steel, hydrogen embrittlement, sulfuric acid, corrosion protection, cathode polarization, tensile strength

ABSTRACT: The effect of cadmium, zinc, nickel, chromium, copper, and brass plating and of aging conditions after deposition on the short-term and long-term static strength of oil-hardened 45 steel was studied by testing in air and in 20% H₂SO₄. The coatings were found to decrease σ_b considerably. Aging for 2 hr. at 210 — 220C completely restored the strength of Cr- and Ni-plated samples, but not in the case of the other deposits. The effect of aging temperature on the recovery of the strength of Cd, Zn, and

Card 1/2

L 14421-66

ACC NR: AP6002119

Cu-plated samples was studied. The decrease in long-term strength observed in the latter case was due to an incomplete desorption of the hydrogen dissolved in the metal. In 20% H_2SO_4 , of all the metals, only the copper deposit provided a complete protection against corrosive attack of the steel. It is postulated that these protective properties are due to the low diffusional permeability of the coating to hydrogen. The copper deposit prevents hydrogen desorption during aging and protects the steel against hydrogen absorption during testing in the electrolyte both with and without cathodic polarization. Copper plating is therefore recommended for practical applications of this type. Orig. art. has: 3 figures and 1 table.

TITLE: Scale factor in the corrosion fatigue of steel and similitude conditions

SOURCE: Fiziko-khimicheskaya mekhanika materialov, v. 1, no. 6, 1965, 730-731

TOPIC TAGS: scale model, similarity theory, corrosion, steel, sodium chloride

ABSTRACT: Using dimensional analysis and its main tool, the π theorem, the authors have determined the similitude criteria for the case of corrosive action of an external working medium on geometrically similar samples of one and the same material subjected to cyclic loads. Of decisive influence on the corrosion process are the electrolyte ions adsorbed on the metal surface in a monolayer; the surface concentration of the electrolyte means the quantity of its ions per unit metal surface in a monolayer. The process of corrosion-fatigue attack is determined by the following quantities (dimensions in parentheses): weight loss during corrosion $K_w(PL^{-2}T^{-1})$; length of sample $l(L)$; diameter of sample $d(L)$; surface concentration of electrolyte $K(PL^{-2})$; testing time $t(T)$; density of sample material $\rho(M/L^3)$.
 Card 1/2

L 14416-66

ACC NR: AP6002125

ρ (PL-3); stresses σ (PL-2) at similar points of geometrically similar samples; external forces $F(P)$ applied to the sample. The following similitude criteria are obtained from the rule of the π theorem:

$$\frac{K_w \cdot t}{K}, \frac{\rho \cdot l}{K}, \frac{\sigma^2}{F}, \frac{1}{d}$$

from which the equation

$$\Phi \left(\frac{K_w \cdot t}{K}, \frac{\rho \cdot l}{K}, \frac{\sigma^2}{F}, \frac{1}{d} \right) = 0.$$

is deduced. The law of similitude is formulated as follows: geometrically similar samples prepared from the same material are considered to be subjected to a similar corrosion-fatigue test if the weight loss K_w of the samples and stresses σ are identical. Hence, with $\sigma = \text{const}$ and $K_w = \text{const}$, and taking (1) into consideration, the following similitude conditions are obtained:

$$\frac{F}{l^2} = \text{const}(2); \frac{t}{k} = \text{const}(3); \frac{1}{k} = \text{const}(4); \frac{1}{d} = \text{const}(5).$$

These conditions were checked experimentally on 40Kh steel. It is concluded that in some cases, instead of full-scale tests of large machine parts operating, for example, in sea water, the tests can be performed on much smaller samples in the laboratory by suitably altering the parameters of the action of the medium.

TOPIC TAGS: photoelasticity, resin, plasticizer, refractory coating, composite material

ABSTRACT: The method of preparation and properties of a new optically active material designated as ED6 MTGFA-58 are described. The material was made by mixing (by weight) 58 parts methyltetrahydrophthalic anhydride (MTGFA) into previously molten 100 parts of ED6 epoxy resin at temperature of 65--70C, and adding in sequence one part dibutyl phthalate, and 0.1 part dimethyl aniline. After polymerization the optical constant and modulus of elasticity at hardening and room temperatures were $\sigma_0^{(1.0)} = 0.38 - 0.4 \text{ kg/cm} \cdot \text{line}$, $E = 200 - 260 \text{ kg/cm}^2$, and $\sigma_1^{(1.0)} = 16.9 - 17 \text{ kg/cm}$

Card 1/2

line, $E = (20 - 30) \times 10^3 \text{ kg/cm}^2$, correspondingly. The time-edge effect was small, i.e., 0.5 lines/cm during 20 days storage. The opticoelastic properties were further checked experimentally in actual photoelastic problems whose theoretical solutions were known and it was established that the two practically coincide. TITLE: Maintenance Workshop of the Stroymekhanizatsiya Trust of Glavkiyevstroy. (Remontno-mekhanicheskiy zavod tresta Stroymekhanizatsiya Glavkiyevstroya).

PERIODICAL: Mekhanizatsiya Stroitel'stva, 1958, Nr.8. pp. 21 - 23. (USSR).

ABSTRACT: In 1956 it was decided to build in Kiyev a maintenance workshop to a standardised plan, worked out by No.3 Design Institute (Proyektnyy institut No.3) for the maintenance of building machines, the manufacture of non-standard equipment etc. Table 1 gives a range of machines overhauled by the above workshop. Description of the lay-out of the factory and various sections is given. The building is constructed of pre-cast reinforced concrete standardised units, the walls are built from pre-cast brick blocks, the trusses are of pre-stressed reinforced concrete type NII-200, and the roofs made from reinforced concrete slabs 6 m x 1.5 m in size. The main section of the factory has a floor area of 6,870 m². Transportation is carried out by bridge cranes of 20-ton capacity. Table 2 gives various specialised trades and number of operatives employed. Lay-out of the factory site, plan and

PERIODICAL: Nauka i zhizn', 1958, ²⁵Nr 8, p 77 (USSR)

ABSTRACT:

In recent years, biology and the technique of cultivating the lemon wormwood was studied in detail at the Sredneaziat-skaya zonal'naya opytnaya stantsiya efiromaslichnykh kul'tur (Central Asian Zonal Testing Station for Ester-Olive Plants). There the plant has been cultivated for the first time. This herb is a very promising plant grown for the production of essential oils. It is found in the Turkmen SSR, in semi-deserts at altitudes of 400-800 m. Commercial cultivation has not yet been successful. At present the sovkhos "Efironos" (Tadzhik SSR) harvested 6 tons of the green herb from 1 hectare from which an average of 0.89 % of the essential oil was extracted. The essential oil of the lemon wormwood contains such sweet-scented substances as citral, geraniol, linalool.

AUTHOR: Tkachenko, P., Engineer-Colonel, Candidate of Technical Sciences

TITLE: On Military Cybernetics ¹⁶

PERIODICAL: Voyenny Vestnik, 1960, No. 2, pp. 92-95

TEXT: The author gives a brief review on electronic digital computers and discusses the nature and tasks of cybernetics in general and military cybernetics in particular. According to foreign press data military cybernetics is based on the theory of information, investigation of operations and electronic digital computers. These three subjects are closely interlinked and in their entity answer the question how and to what extent electronic computers can be used. Three categories of operations are mentioned: mechanical, human and mixed, i.e., performed by humans in charge of mechanisms. The investigation of operations in respect of mechanical systems is comparatively easy and can be solved by a normal mathematical process. However, operations involving human and mixed units are still presenting considerable difficulties as there is the human element to consider which cannot be translated into any of the known computing

Card 1/3

82809

On Military Cybernetics

S/018/60/000/002/001/001

systems. Foreign countries particularly the USA, are working intensively on development of a new computer able to consider chance factors and solve combat problems involving human or mixed units. The new computer is based on the theory of linear programming, i.e., the most effective distribution of available resources, the theory of games, i.e., the development of best combat tactics and the anticipation of enemy's losses and counteraction on a minimum of beforehand information; and the theory of simulation, i.e., the simulation of combat actions to establish the most probable results. The following works dealing with the theory of games were published in the USA: "The Strategy of Poker, Business and War"; "The Perfect Strategist or the Handbook of Strategical Game Theory"; "The Analytic Study of Military Games" and "The Duel of Tanks and Problems of the Theory of Games". The theory of games is still far from perfection, its main difficulty being the mathematical expression of concrete military data, e.g., the losses of one side and the gains of the other. Foreign military press mentions the following methods applied in the theory of simulation: analytic, statistical and methods based on the probability theory. The analytical method has been frequently used for the mathematical description of a battle, e.g., the work by Brakni (Brakney) "Dynamics of Combat" published in 1959. This method has only a limited scope, e.g., actions of not too large

Card 2/3

On Military Cybernetics

82809

S/018/60/000/002/001/001

sub-units, in which the essential part is played by aircraft, tanks etc. The probability method is a perfected form of the analytic method though its applicability remains limited. The statistical method (particularly the "Monte Carlo" method) appears to have the highest possibilities. It is based on electronic digital computers, on which all available actual and tactical data are recorded. As the outcome of every combat is also determined by a number of unpredictable chance factors, these are taken into consideration by introduction of perturbation into each element of action by the generator of chance digits. Each battle is repeated 50-100 times on the electronic model and the summary of results provides reliable data which can be applied to real-life actions. The following electronic computers for military purposes are developed in the USA: automatic command system "Seydzh" for PVO (Anti-Aircraft Defense) troops (Ref. 1), automatic army supply system "Maas" (Ref. 2), automatic system for collection and evaluation of information on the scale Regiment - Army "Fildata" (Ref. 3) and the prospective automated command system "Armydata" (Ref. 3). There are 3 English references.

TITLE:

The Passing of Discharges Through the Water Pipes of Turbine Units During Construction at the Irkutsk Hydroelectric Power Plant (Prepusk stroitel'nykh raskhodov cherez vodovody turbinnykh blokov Irkutskoy GES)

PERIODICAL:

Gidrotekhnicheskoye Stroitel'stvo, 1958, Nr 5, pp 17-22(USSR)

ABSTRACT:

The comparison of laboratory and actual observations makes it possible to determine the general regularity of hydraulic processes with respect to unfinished turbine units and in making decisions for their utilization in the planning of projects. The Irkutskaya gidrostantsiya (Irkutsk Hydroelectric Power Plant) projected by Chief Engineer G.K. Sukhanov of the Moskovskoye otdeleniye instituta "Gidroenergoprojekt" (Moscow Branch of the "Gidroenergoprojekt" Institute), has turbine units of different design and therefore they are suitable for carrying out hydraulic investigations. In figure 1, three turbine units of different design are shown. After

Card 1/2

98-58-5-4/33

The Passing of Discharges Through the Water Pipes of Turbine Units During Construction at the Irkutsk Hydroelectric Power Plant

examining the different types, the 2nd turbine unit must be regarded as the most suitable, for it ensures favorable hydraulic conditions for the passing water current. A turbine unit of this type is also the most appropriate with respect to the second stage of the concrete work to be performed. Furthermore the study of hydraulic processes is possible by using water pipe models of hydrotechnical construction. The best material for these models is organic glass, for it offers the possibility of observing the stream inside the water pipes.

There are 4 figures, .
